⌄ Homework 4

Instructions

- This homework focuses on understanding and applying CoCoOp for CLIP prompt tuning. It consists of **four questions** designed to assess both theoretical understanding and practical application.

- Please organize your answers and results for the questions below and submit this jupyter notebook as **a .pdf file**.

- **Deadline: 11/26 (Sat) 23:59**

⌄ Preparation

- Run the code below before proceeding with the homework.
- If an error occurs, click 'Run Session Again' and then restart the runtime from the beginning.

⌄ Q1. Understanding and implementing CoCoOp

- We have learned how to define CoOp in Lab Session 4.

- The main difference between CoOp and CoCoOp is **meta network** to extract image tokens that is added to the text prompt.

- Based on the CoOp code given in Lab Session 4, fill-in-the-blank exercise (4 blanks!!) to test your understanding of critical parts of the CoCoOp.

```python
import torch.nn as nn

class CoCoOpPromptLearner(nn.Module):

## Q3. Analyzing the results of CoCoOp

Compare the results of CoCoOp with those of CoOp that we trained in Lab Session 4. Discuss possible reasons for the performance differences observed between CoCoOp and CoOp.

CoCoOp achieved a test accuracy of 43.3% on the EuroSAT dataset, lower than CoOp's performance in Lab Session 4. CoOp's static prompts, optimized for specific classes, proved more robust in a few-shot setting, while CoCoOp's dynamic prompts, designed to adapt to image features, struggled with generalization. The fluctuating losses and slower convergence in CoCoOp indicate optimization challenges, and the added complexity of its meta-network may have introduced noise or overfitting, further impacting performance.
